

Required Documents and Process for Solar Energy System Installation

This document explains the main documents and steps required for evaluating, designing, installing, connecting a solar energy system to the grid, and registering the customer as an active consumer.

Volt.az supports the customer during the technical evaluation, design, installation, documentation, and activation stages.

Established: 2026
Publishing Date: June 2026
Document Version: 1.0
Prepared by: Solarix LLC

Institution: Volt.az

Initial Documents Required by Volt.az

These documents are required at the first stage so Volt.az can evaluate the project, understand the customer's electricity needs, inspect the property conditions, calculate a suitable solar system capacity, and prepare a technical proposal.

1. Document Confirming Property Ownership — Extract

What it is:

This is the official document confirming the ownership rights over the property where the solar energy system will be installed. It may be an extract from the state register of real estate or another legally valid ownership document.

Why it is required:

The solar system is installed on a specific property. Therefore, before technical design and official documentation, ownership or legal use of the property must be confirmed.

Where to get it:

The property owner may obtain or check this document through official real estate and government services, including:

- State Service on Property Issues under the Ministry of Economy
- e-Gov portal
- e-emlak services
- myGov personal cabinet
- ASAN Service centers, where applicable

2. Copy of ID Card

What it is:

A copy of the ID card of the subscriber, property owner, or authorized representative.

Why it is required:

The ID card is needed to identify the customer, prepare project documents correctly, and match the customer's details with the property and electricity subscription information.

Where to get it:

The customer provides a copy or photo of the valid ID card.

3. Azərişiq Subscriber Code or Latest Electricity Payment Receipt

What it is:

The Azərişiq subscriber code is the electricity subscription number linked to the property. If the

customer does not know the subscriber code, a recent electricity payment receipt may also be provided.

Why it is required:

The subscriber code helps identify the electricity account of the property. It may be used to review consumption information, connection details, existing supply conditions, and to prepare the correct documentation for the solar project.

Where to get it:

- From the latest electricity payment receipt
- From the Azərişiq personal cabinet
- From Azərişiq electronic services
- From payment terminals or banking applications where electricity payments are made
- From Azərişiq customer service, if required

4. Property Address or Location Coordinates

What it is:

The exact address of the property or its location coordinates.

Why it is required:

Volt.az needs the property location to evaluate roof direction, sunlight exposure, possible shading, installation area, access conditions, and technical feasibility.

Where to get it:

- Property documents
- Google Maps or similar map applications
- Shared location from a mobile phone
- Manual address information provided by the customer

What Volt.az Prepares

After receiving the initial documents and information, Volt.az evaluates the project and prepares the technical and installation-related documents.

1. Technical Project of the Solar Power Station

What it is:

A technical project describing the solar energy system.

What it may include:

- Number of solar panels
- Panel model
- Inverter model
- Total system capacity
- Inverter capacity
- MPPT inputs
- String distribution
- Panel placement and layout
- Electrical connection details

Who prepares it:

Volt.az prepares the technical project based on site assessment, equipment selection, and customer requirements.

2. Panel and Inverter Information

What it is:

Technical information about the main equipment used in the system.

Why it is important:

The panel and inverter models define the system's power, efficiency, reliability, monitoring options, and technical compatibility.

Who prepares it:

Volt.az selects and provides equipment information according to the project size, roof conditions, and customer needs.

3. Electrical Connection Scheme

What it is:

A single-line electrical scheme showing how the system is connected.

What it may show:

- Solar panels
- Inverter
- Protection devices
- MCCB / circuit breakers
- Differential protection
- Two-way meter
- Grid connection
- Grounding system

Why it is required:

The electrical scheme is required for technical clarity, safety, installation quality, and official documentation.

4. Installation Act

What it is:

A document confirming that the installation works have been completed.

What it may include:

- Customer information
- Property address
- Panel and inverter models
- System capacity
- Installation date
- Technical executor
- Inspection results
- Signatures and stamps

Who prepares it:

Volt.az prepares the installation act after completion of installation works.

5. Safety, Grounding and Protection Information

What it is:

Information about the safety elements used in the solar system.

What it may include:

- Circuit breakers
- Surge protection devices
- DC and AC protection
- Grounding details
- Cable protection
- General electrical safety notes

Why it is required:

A solar energy system must operate safely and in accordance with technical standards.

6. Monitoring Information**What it is:**

Information related to the monitoring application or inverter platform.

What the customer can monitor:

- Energy production
- Energy consumption
- Energy imported from the grid
- Energy exported to the grid
- Inverter status
- Daily, monthly, and yearly performance
- Technical alerts

Who provides access:

After system activation, Volt.az may provide the customer with access to the monitoring application.

Institution: ASAN Kommunal / Azərişiq ASC

Registration of the Active Consumer

When the solar energy system is connected to the grid and the customer plans to export excess electricity to the grid, the customer must be registered as an active consumer.

An active consumer is a person or legal entity that produces electricity from renewable energy sources, uses it for their own needs, and may transfer surplus electricity to the grid.

Required Documents

1. Subscriber's ID Card

What it is:

The ID card of the electricity subscriber.

Why it is required:

It confirms the identity of the subscriber applying for active consumer registration.

Where to get it:

Provided directly by the subscriber.

2. Subscriber Code

What it is:

The electricity subscriber code linked to the property.

Why it is required:

It identifies the electricity account and allows the relevant institution to process the application correctly.

Where to get it:

- Electricity payment receipt
- Azərişiq personal cabinet
- Azərişiq electronic services
- Payment applications or terminals
- Azərişiq customer service

3. Existing Technical Condition

What it is:

The current technical condition issued by the electricity supply network.

Why it is required:

It shows the existing electricity connection details, allowed capacity, connection voltage, and technical conditions of the property.

Where to get it:

From Azərişiq or the relevant electricity supply authority, depending on the property and previous connection documents.

4. Project Documents

What it is:

Technical project documents reflecting the characteristics of the solar power station.

What it may include:

- Number of panels
- Panel model
- Inverter model
- System capacity
- Connection scheme
- Technical indicators
- Layout and string distribution

Who prepares it:

Volt.az prepares these documents as part of the project documentation.

5. Technical Installation Act

What it is:

An act confirming that technical installation works have been completed.

Why it is required:

It confirms that the system has been installed and is ready for review, connection, or activation.

Who prepares it:

Volt.az prepares the installation act after completing the installation works.

Service Period

The active consumer registration service period is usually indicated as 20 days.

Important Note

If the application is submitted by someone other than the subscriber, a legally valid power of attorney and the applicant's ID document may be required.

Institution: Azərişiq ASC

Grid Connection and Meter Installation

Azərişiq ASC carries out the technical review, application, contract preparation, meter installation, and grid connection stages for micro-generation systems.

1. Application to the Regional Azərişiq Office

What it is:

An application submitted to the relevant regional electricity supply and sales office.

What it may include:

- Property address
- Subscriber code
- Contact details
- Request for installation of an import/export meter
- Project information

Where to apply:

Through Azərişiq / ASAN Xidmət / ASAN Kommunal channels, depending on the applicable process.

2. Review of Technical Conditions

What it is:

Azərişiq reviews the existing technical condition and technical possibility of grid connection.

What is checked:

- Existing connection capacity
- Required solar system capacity
- Connection voltage
- Connection point
- Subscriber code
- Metering and safety requirements

3. Electrical Connection Scheme

What it is:

A single-line scheme showing how the solar system is connected to the electrical network.

Who prepares it:

Volt.az prepares the scheme as part of the technical project.

Why it is required:

It helps Azərişiq understand the connection structure and ensures the system meets safety and technical requirements.

4. Installation of Import/Export Type Meter

What it is:

A two-way meter that records both directions of electricity flow.

What it measures:

- Electricity received from the grid
- Electricity transferred to the grid

Why it is required:

It is necessary for active consumer settlement and proper calculation of imported and exported energy.

5. Service Contract

What it is:

A contract for meter installation and grid connection services.

Where it is signed:

Through Azərişiq / ASAN Xidmət channels, depending on the process.

6. Price Agreement Protocol and Payment

What it is:

A document showing the cost of works and equipment related to the meter installation and connection.

What it may include:

- Meter cost
- Installation service cost
- Related technical service costs

Payment:

The customer makes the required payment according to the contract and price agreement protocol.

7. Balance Ownership and Operational Responsibility Act

What it is:

An act defining the boundary of responsibility between the customer and the electricity supply company.

Why it is important:

It clarifies which part of the electrical network is under the customer's responsibility and which part is under the network operator's responsibility.

8. Electricity Purchase and Sale Agreement

What it is:

An agreement or addendum signed between the active consumer and Azərişiq ASC.

Why it is required:

It regulates the calculation and settlement of electricity imported from and exported to the grid.

9. Export of Excess Energy and Settlement

What it means:

Electricity produced by the solar system and not consumed by the customer may be transferred to the grid.

How it is recorded:

The two-way meter records both imported and exported electricity.

How settlement is made:

Settlement is carried out according to the applicable active consumer and support mechanism rules.

Prepared by Solarix LLC

Volt.az is a solar energy service brand operated by Solarix LLC, providing consultation, design, installation, documentation support, and grid connection assistance for solar energy systems in Azerbaijan.

This document has been prepared to give customers a clear, simple, and professional overview of the documents and steps required to start and complete a solar energy project.
